EDUCATION

Texas A&M University, College Station, Texas

May 2027

Bachelor of Science in Computer Engineering, Engineering Honors (GPA: 4.0)

TECHNICAL SKILLS

Programming Languages: C, C++, Python, C#, Java, Kotlin, PHP, MySQL

Developer Tools: Git, Visual Studio, WPF, Android Studio, Linux, ROS2

Hardware/Embedded: Altium Designer, Arduino, STM32, PCB Layout & Testing

EXPERIENCE

Exile Technologies - Software Developer (Internship), Houston, Texas

May 2024 – Present

- Developed and enhanced several graphical applications using C# with WPF to improve efficiency and usability and fix bugs.
- Implemented and tested 3 interlacing algorithms and integrated the best into the control panel for all Spyder printers.
- Improved a current printing algorithm to increase the maximum size that it can print and decrease printing time.
- Created a website with PHP/MySQL for tech support to view diagnostic data with interactive graphs and tables.

Exile Technologies - Software Developer (Internship), Houston, Texas

June 2023 – August 2023

- Developed a web application using PHP/MYSQL on an Ubuntu Server to manage tasks for multiple teams.
- Collaborated with engineers to incorporate user feedback, refining the application to better meet team needs.
- Enhanced the task management application by implementing features such as data visualization and Bing Maps integration.

ACTIVITIES

Aggie Robotics – Team WHOOP5 - Software lead

January 2024 – May 2025

- Integrated ORB SLAM3 visual odometry with rotation sensors and an IMU to create a robust odometry system.
- Configured ROS2 on a Raspberry Pi to run SLAM, control object detection, and communicate with the robot's controller.
- Developed a versatile and robust serial communication interface between the Pi and the robot controller.
- Collaboratively programmed C++ software components for robots competing in VEX U State and World Competitions.

PROJECTS

RP42 Calculator | jeremy924.github.io/rp42/

July 2024 – Present

- Optimized component selection for low power consumption ($<600\mu\text{W}$), low cost ($<\$30$ BOM), and ease of assembly.
- Tested and debugged prototype using multimeter, oscilloscope, variable power supply, and the ST-Link debugger.
- Developed firmware in C, integrating QSPI, SPI, USB, and GPIO interfaces to control the flash memory, LCD, and buttons.
- Ported Free42 calculator code written in C++ to run on the custom RP42 hardware platform.

Video Game Controller | github.com/Jeremy924/GameController

December 2023

- Created a PCB with Altium to connect 2 joysticks, 4 buttons, and an Arduino Nano together.
- Implemented an efficient program with C for sending data from controller to computer over USB.
- Developed a versatile Python script for translating joystick motions into keyboard presses for games like Forza.

CERTIFICATIONS

- Red Hat Preliminary Exam in Red Hat System Administration 1 (PE124)

July 2024
